Angle of Repose and Effect of Glidants

Experiment 9 - Practical Notes

Name: _____ Roll no.: _____ Date: _____

Aim

To compare powder-pile angle with and without an assigned glidant.

Principle

A powder cone's height and base radius define its repose angle under the chosen formation method. Friction, cohesion, particle size and humidity influence the result. A glidant can alter the measured flow pattern at a suitable concentration.

Requirements

- Assigned powder and glidant concentration, for example a supervised 0.5% w/w teaching blend.
- Fixed funnel setup, flat base, ruler, balance and mixing vessel.

Procedure

1. Control setup

Fix the funnel geometry, outlet-to-base position, powder amount, base surface and room conditions. Record whether height is fixed or adjusted by the prescribed method.

2. Untreated powder

Allow powder to form a cone without vibration or external pushing. Measure height h and two perpendicular base diameters.

3. Calculate radius

Use half the mean diameter as radius r . Repeat pile formation and record each result.

4. Prepare blend

Weigh the prescribed glidant and mix by a controlled method. Keep the same total test mass and setup.

5. Repeat

Form replicate cones for the treated powder and record h , r and any irregularity or failure to flow.

6. Compare

Calculate $\theta = \arctan(h/r)$ in degrees. Compare conditions and replicate spread; do not assume that more glidant always improves flow.

Physical Pharmaceutics**Observations and Record**

Powder condition	h / r (same units)	Angle θ (degrees)
Without glidant	_____	_____
With glidant	_____	_____
Replicate / room conditions	_____	_____

Worked Example

The numbers below are illustrative; enter your own observations in the record.

- Untreated $h = 3.0$ cm and $r = 5.0$ cm gives $\theta = \arctan(0.60) = 30.96^\circ$.
- Treated $h = 2.5$ cm and $r = 5.0$ cm gives $\theta = 26.57^\circ$ under the same method.

Result

Record the observed outcome and calculated value, with units. State whether the stated laboratory specification was met; do not copy the worked example as your result.

Precautions

- Use the instructor's assigned material and apparatus; record actual temperature and units with every measured property.
- Check instrument calibration and use repeat readings rather than a single convenient result.
- Compare a marketed teaching formulation only under the same method and conditions; its excipients can change the property.

Viva Questions and Answers**1. Why use radius rather than diameter?**

The cone geometry uses h/r .

2. Why control humidity?

Moisture can change interparticle adhesion.

3. Does one lower angle prove all processing problems are solved?

No. Other flow, segregation and compaction properties still matter.
